Hi, I just spent almost a day (actually a whole nite) to properly configure and install the plugin (configuration was quite painful for me).

I think a better manual would help, and to help you on your task could you make the wiki editable to that users could share their experience and add some howto/tricks to the documentation?

For instance, if the wiki was editable now, I would have started an explanation on how to configure properly the PBI/Tasks ...

I agree on this issue. The field names and the wiki are really confusing.

On this topic, I started a wiki page to explain it better. It moves very slowly as I got only so much time on it, but you can see it going here:
