Description			
I would like to use Milestone for Release planning. So it would be very useful to be able to assign tickets to a Milestone.			
The way I see it working is:			
<ol style="list-style-type: none">1. I plan for next big product release which involves a few Redmine projects2. I create a new Milestone for that (I call it Release) and create a set of "Features" for the release.3. Now I create new version for each project involved and assign it to the Milestone4. Now, within a project version I create subticket of Milestone features for implementing this feature within this project version5. Then we could have a Spring in each project for a feature implementation.			
Do you think it makes sense?			

History

It's not feasible with current plugin design. At least without starting from scratch...

Just an idea, did you consider to group release/milestone features under a version? from my understanding then you could still create other subtickets on other projects and versions as you described. Does it makes any sense for you?

#2 - 2017-05-20 00:23 - Artur H

Yes, this is how we do it right now. We have a dedicated project for releases planning. In the project we create a new Milestone and a new Version plus we assign to the milestone Versions from other projects which are related.
